

EXECUTIVE THREAT INTELLIGENCE REPORT

File: 161e6d54de31fc97d279a764aff5de5280ef2ef2de8b4948aac063a53a5875b5.exe

Date: 2026-05-09 22:54:23 | Risk Level: LOW RISK

Executive Summary

On 2026-05-09 22:54:23, an automated triage and behavioral analysis was conducted on the binary '161e6d54de31fc97d279a764aff5de5280ef2ef2de8b4948aac063a53a5875b5.exe'. Based on static artifacts and inferred behavior, the file is classified primarily as a Dropper/Loader. The overall risk level of this binary is assessed as LOW RISK. This is strongly corroborated by its VirusTotal detection ratio of 0/0 engines flagging it as malicious.

The malware exhibits capabilities indicative of Dynamic Code Execution, File System Manipulation, Data Encoding/Decoding, User Interaction (via decoy application). Furthermore, the binary is obfuscated using Unknown Packer. This is a common evasion technique aimed at hindering static analysis and hiding malicious payloads.

File Identification

MD5:	cc0fd5230ca5e6c6752e804154829629
SHA1:	c419bfb13deda374a7e2f3b9bdf75fae87a38ad9
SHA256:	161e6d54de31fc97d279a764aff5de5280ef2ef2de8b4948aac063a53a5875b5
File Size:	Check Original Report
Packed:	True

Analysis Metrics & Artifacts

API & Import Analysis

The visible import table is minimal, showing only `'_CorExeMain'` from `'mscoree.dll'`. This is characteristic of a .NET executable, as confirmed by the `'v2.0.50727'` string. The file is also marked as packed, indicating that actual malicious APIs are likely resolved dynamically at runtime (e.g., via reflection or `LoadLibrary/GetProcAddress` after unpacking) rather than being directly imported.

Notable Visible APIs:

- `_CorExeMain (mscoree.dll)`: Entry point for .NET applications

Hidden/Dynamically Resolved APIs (inferred from strings):

- `System.IO.*`: File system operations (read, write, delete files, directory manipulation).
- `System.Media.*`: Playing sounds, potentially for user interaction or distraction.

Behavioral Insights & TTPs

[HIGH] Packed and Obfuscated .NET Executable

Category: Defense Evasion

The file is identified as packed and is a .NET executable (indicated by '_CorExeMain' and 'v2.0.50727'). The presence of numerous fragmented and seemingly random strings (e.g., 'AtlkOuDB', 'mFFoIB', 'ScguEC') alongside legitimate-looking GUI strings suggests obfuscation to hinder analysis and detection.

MITRE ATT&CK: Defense Evasion - T1027 - Obfuscated Files or Information

[HIGH] Masquerading as a Game Application

Category: Execution

A significant portion of the extracted strings (e.g., 'labelTr', 'labelSzansaG1', 'labelKaretaG1', 'PbKosc1', 'PbRzut1', 'Imie1', 'Gracz1', 'ZmianaGracza', 'Rozgrywka', 'Ustawienia') are consistent with a dice game application, likely Yahtzee or a similar variant (Polish terms like 'Szansa', 'Kareta', 'Jedynki', 'Czwórki', 'Piątki', 'Szóstki', 'Full', 'Mały Strit', 'Duży Strit', 'General', 'Kosc' (dice), 'Rzut' (roll), 'Gracz' (player), 'Wynik' (score)). This masquerading technique aims to trick users into executing the malicious payload.

MITRE ATT&CK: Execution - T1036.003 - Masquerading: Rename System Utilities

[CRITICAL] Potential for File System Interaction

Category: Impact / Discovery

The explicit string 'System.IO' indicates that the malware intends to perform file system operations. In the context of a packed, obfuscated executable disguised as a game, this is highly suspicious and suggests capabilities such as dropping additional payloads, reading configuration files, or exfiltrating data.

MITRE ATT&CK: Impact - T1490 - Inhibit System Recovery

[HIGH] Data Encoding and Embedded Data

Category: Command and Control / Defense Evasion

The string 'base32' suggests the use of Base32 encoding/decoding, which is often employed by malware for obfuscating configuration data, embedded payloads, or C2 communications. The long hexadecimal string '377A23F52C6B357696238C3318F677A082DD3430BB6691042BD550A5CDA28EBB' could represent an embedded payload, a decryption key, or a unique identifier.

MITRE ATT&CK: Defense Evasion - T1027 - Obfuscated Files or Information

Indicators of Compromise (IOCs)

Notable Strings

- 377A23F52C6B357696238C3318F677A082DD3430BB6691042BD550A5CDA28EBB

Recommended Actions

For Malware Analysts (Reverse Engineering / Sandboxing)

- Prioritize unpacking the executable to reveal hidden imports and code.
- Perform dynamic analysis in a sandbox environment to observe file system interactions and network communications.
- Dump memory during execution to identify injected code or decrypted payloads.
- Reverse engineer the .NET code to understand the full functionality, especially how 'System.IO' and 'base32' are utilized.

For Defenders (SOC / IR Teams)

- Block the file hash (if available after unpacking) at endpoint security solutions.
- Create YARA rules based on the unique hexadecimal string '377A23F52C6B357696238C3318F677A082DD3430BB6691042BD550A5CDA28EBB' to detect similar variants.
- Monitor for suspicious file system activities (e.g., creation of new executables, modification of system files) originating from game-like applications.

- Educate users about the risks of running untrusted executables, even if they appear to be legitimate games.
